- INCORPORATED MUNICIPALITIES
- WATER

■ The Cropland layer depicts the highest ranking 50% of the remaining unpreserved parcels with cropland that occur outside of state designated growth areas. This data was derived through use of the nationally recognized Land Evaluation Site Assessment system. This mapped data should be reviewed in conjunction with the text Livable Delaware Advisory Council approved "Green Infrastructure Strategy."

◆ The Forestland layer depicts the highest ranking 50% of the remaining unpreserved parcels with forestland that occur outside of state designated growth areas. This data was derived through use of the nationally recognized Land Evaluation Site Assessment system. This mapped data should be reviewed in conjunction with the text Livable Delaware Advisory Council approved "Green Infrastructure Strategy."

● This layer identifies a network of ecologically important natural resource lands of special state conservation interest. Generally, it depicts corridors of the largest, most connected natural habitat throughout the state, including forests, uplands and wetlands. It was derived through interpretation of the most important known rare species sites, existing protected lands, 1997 statewide aerial photography, regional ecological evaluations by the USF&W Service, The Nature Conservancy, and the Delaware Natural Areas, Natural Heritage, and Open Space Programs. The lines on the map must be considered on the basis of the scale at which they are shown and the data from which they were derived. The lines are not parcel based, nor are they exact, but a close approximation.
